GENERAL TABLES	
Table I.—Total births and deaths (exclusive of stillbirths) with rate per 1,000 population for the years 1914-1939, inclusive	14
Table II.—Births (exclusive of stillbirths) in each county, by color, with rate per 1,000 population; per cent attended by physicians and number illegitimate, 1939	15
Table II-A.—Births (exclusive of stillbirths) in each city of 10,000 population or over in 1930, by color, with rate per 1,000 population; per cent attended by physicians and number illegitimate, 1939	19
Table III.—Deaths (exclusive of stillbirths) for the State as a whole from each cause, by sex, color and age 1939 (includes all deaths occurring in North Carolina)	20
Table IV.—Deaths (exclusive of stillbirths) in each county, by color, with rate per 1,000 population, 1939	64
Table V.—Deaths (exclusive of stillbirths) in each county, by cause of death (abridged international list) and by color of decedent, 1939	68
Table VI.—Deaths (exclusive of stillbirths) in cities or towns, by cause of death (abridged international list) and by color of decedent, 1939	118
Table VII.—Death rates per 100,000 population (by place of death, also by place of usual residence) in each county, from nine important causes, with estimated population, 1939	128
Table VIII.—Deaths (exclusive of stillbirths) by cause by certain subdivisions of the first year of life, 1939	132
Table IX.—Deaths under 1 year of age (exclusive of stillbirths), and maternal deaths in each county with rates per 1,000 live births, 1939	134
Table X.—Cases and deaths from special diseases by month of occurrence, 1939	136
Table XI.—Cases from 30 of the reportable diseases by counties, 1939	140
Table XII.—Death rates per 100,000 population from ten important causes, for the State as a whole, with estimated population for each year 1914-1939	144

LETTER OF TRANSMITTAL

Raleigh,

March 3, 1941.

*To His Excellency, J. MELVILLE BROUGHTON,
Governor of North Carolina,
Raleigh.*

My dear Governor Broughton:

I have the honor of transmitting the report for the Bureau of Vital Statistics covering the calendar year 1939.

With assurance of my very best respect, I am

Very sincerely,

CARL V. REYNOLDS, M. D.,
Secretary and State Health Officer.

ANNUAL REPORT OF THE BUREAU OF VITAL STATISTICS

This annual report of the Bureau of Vital Statistics presents tabulations of births and deaths for the calendar year 1939. The Bureau of Vital Statistics was established July 1, 1913 by legislative enactment and began the registration of births and deaths in October of the same year, but it was not until 1916 for deaths and 1917 for births that registration was complete enough for admission to the United States Registration Area.

The first annual report contained tabulations for 1914, and a report has been published annually ever since with the exception of 1918 and 1919. Beginning with the 1931 report county and city tabulations have been made according to the abridged International List of Causes of Death. State tabulations have continued to be made according to the detailed International List. The present report follows the plan begun in 1932 of tabulating births and deaths both by place of occurrence and by place of residence. Births have been allocated to the legal residence of the mother and deaths to the place of legal residence before death of the deceased. In order to permit comparison with years before tabulations by place of residence were begun, deaths and births have been recorded by place of occurrence and by place of residence.

Although tabulation by residence corrects one, probably the greatest, source of error in comparing the rates of different localities there are other factors that must be taken into consideration. For example, the rates given in this report are crude rates in the calculation of which no allowance is made for the differences in sex, age and color distribution of the population. Furthermore, the degree of completeness of reporting may vary in different localities and this should be taken into consideration when comparing the rates of two areas.

POPULATION

The population estimates for the State and its political subdivisions should be approximately correct since they were calculated arithmetically following the 1940 census. State rates are based on an estimated population of 3,534,000.

NATALITY

Live Births: The birth rate of 22.3 per 1,000 population was slightly lower than for 1938. In actual numbers there were

78,957 births compared to 79,903 in 1938. Of the 78,957 live births, 53,222 were white; 24,932 negro; and 803 Indian, representing rates of 21.4 per 1,000 population for white and 24.2 for negro. The birth rate ranged between 30 and 35 per 1,000 population from 1914 to 1924. From the latter date the rate dropped rapidly to 24.7 in 1929 and since that time there has been only a slight downward tendency.

Stillbirths: In conformity with statistical practice, the stillbirths were not included in the totals of either births or deaths, but tabulated separately. There were 2,870 stillbirths, or 216 fewer in 946 less births than in 1938. This represents a decline in the stillbirth rate from 38.6 to 36.3 per 1,000 live births.

MORTALITY

In the compilation of mortality statistics the cause of death as stated by the physician is used as the basis of classification by causes. Since the accuracy of statistics can be no greater than that of the material upon which they are based, it is desirable that physicians give as accurate and complete a diagnosis of the cause of death as possible. A specific cause, rather than a general condition or symptom, is essential if the greatest accuracy is to be expected. Failure to conform with this rule necessitates that hundreds of certificates be queried yearly as to cause of death in order to classify them correctly.

The health conditions in North Carolina for 1939 as indicated by the death rate were, in general, more favorable than for the preceding year. There were fewer deaths recorded from all causes combined and consequently a lower death rate than for 1938. The 31,785 deaths, exclusive of stillbirths, represent an annual death rate of 9.0 per 1,000 population. The mortality rate for 1938 was 9.5 per 1,000 population. The mortality rate for 1937 was 9.7; for 1936, 10.3; and for 1935, 9.8. Considered in terms of total deaths, the number reported for 1939 was 1,779 fewer than for 1938.

When the deaths are analyzed by cause it is discovered that the group of degenerative diseases caused approximately the same number of deaths as in 1938. This group—heart diseases, chronic nephritis, apoplexy, cancer, diseases of the arteries, and diabetes mellitus,—six in all, accounted for 14,675 in 1938 and 14,533 in 1939. These degenerative diseases accounted for approximately 46 per cent of all deaths in 1939 and 44 per cent in 1938.

TABLE 1. DEATHS FROM DEGENERATIVE DISEASES

<i>Cause of Death</i>	<i>Number</i>	
	1938	1939
Heart Diseases -----	5,819	5,704
Cerebral Hemorrhage -----	3,051	3,020
Chronic Nephritis -----	3,057	2,923
Cancer -----	1,915	1,993
Diabetes -----	379	498
Diseases of the Arteries -----	454	395
Total -----	14,675	14,533

The principal causes of death in 1939 in order of their rank were diseases of the heart, nephritis, apoplexy, the pneumonias, congenital malformations and diseases of early infancy, violent and accidental deaths, exclusive of homicides and suicides, cancer and tuberculosis. This order is entirely different from that shown twenty-five years ago, the first year of registration, when tuberculosis ranked first with a rate of 139 deaths for every 100,000 population. Tuberculosis ranked eight in 1939 with a rate of 51.3.

Heart diseases rank first in 1939 in the list of causes of death. In 1914 there were 1,780 deaths charged to this condition and in 1939 diseases of the heart, including angina pectoris, accounted for 5,704 deaths. This represents a rate twice that of 1914. Cerebral hemorrhage, second in importance, was sixth twenty years ago. The death rate from pneumonias has changed little, but due to the increase in deaths from other conditions, pneumonia has dropped from second to sixth place. Diarrhea and enteritis, a major cause of death in 1914, is ninth in 1939. The rate has fallen from 98.8 per 100,000 population in 1914 to 26.1 in 1939. Modern sanitary measures have played a large part in reducing the death rate from diarrhea among infants.

Typhoid Fever: The death rate from typhoid fever, after a slight increase in 1937, again showed a decrease, continuing the downward trend shown annually since 1932 with the exception of 1937. The 48 deaths were 23 less than for 1938. The improvement in the condition since the beginning of registration can be appreciated by comparing the rate of 35.8 in 1914, or a total of 839 deaths, to the present low rate of 1.4 or 48 deaths.

Smallpox: There was no death from smallpox in 1939. With the exception of one death in 1937 there has not been a death

reported from this disease since 1931. Fifteen cases were reported to the Division of Epidemiology in 1939 and thirty-five in 1938.

Diphtheria: The record for 1939 shows five fewer deaths and a slightly lower death rate from diphtheria than for 1938. There were 168 deaths with a rate of 4.8 per 100,000 population compared to 173 deaths with a rate of 4.9 for 1938. There was a seventy per cent reduction in the mortality rate from this disease from 1915 to 1932, but no significant decrease in the rate since. In round numbers, five-sixths of the deaths from diphtheria occur in children under five years of age. This indicates that vaccination to be most profitable must be done long before the child becomes of school age.

Influenza and Pneumonia: There were 2,103 deaths from pneumonia and 644 deaths from influenza, making a total of 2,747 recorded for 1939. The deaths from these two conditions give a rate of 77.7 per 100,000 population for 1939 as against a rate of 91.4 for 1938. There were 139 more deaths from influenza during 1939 than for the previous year and 614 fewer from pneumonias.

Tuberculosis: The death rate from all forms of tuberculosis was 51.3 in 1939 and 52.2 in 1938. This represents a decrease in actual numbers of 41. Tuberculosis ranked first among all causes of death in 1914, but has fallen to eighth place in 1939. In the past twenty years the mortality rate has declined by approximately 65 per cent.

Of the 1,812 deaths from all forms of tuberculosis, 51.0 per cent were males and 49.0 per cent females; 39 per cent were white and 61 per cent colored. The colored rate of 105.9 for tuberculosis is almost four times the white rate of 28.3.

Cancer: Cancer accounted for 1,993 deaths in 1939, giving a rate of 56.4 against a rate of 54.3 for 1938 and 54.8 for 1937. Taken over a number of years the general trend of cancer mortality has been upward, but for four years prior to 1937 we had at least held our own. In 1938 there were 3 more deaths than in 1937, and 78 more this year than in 1938.

Pellagra: The 209 deaths from pellagra, representing a mortality rate of 5.9 per 100,000 population, was a decrease over the rate of 7.3 for 1938. There has been a downward trend in mortality from this disease since 1930 with the exception of 1934 and 1937. The peak year for pellagra deaths was 1930 when 1,015 were charged to this disease.

Suicides and Homicides: There were 287 suicides in 1939 and 332 in 1938. The 45 fewer deaths decreased the rate from 9.4 per 100,000 population in 1938 to 8.1 in 1939. There were 39 fewer homicidal deaths in 1939 than in 1938, the totals being 408 and 369 respectively.

Accidental Causes: Violent and accidental deaths, exclusive of suicides and homicides, accounted for 2,279 deaths, 62 more than in 1938. Violent and accidental deaths rank fifth among the principal causes of death. Automobile accidents accounted for the greatest number of the accidental deaths. There were 917 deaths from all types of automobile accidents in 1939 and 906 in 1938. Railroad accidents, exclusive of collisions with automobiles, caused 90 deaths in 1939 and 89 in 1938.

Maternal Mortality: The diseases of pregnancy, childbirth and the puerperal state continued to exact a large number of lives. Deaths from maternal causes and the maternal mortality rates per 1,000 live births for the past ten years are shown in Table 2. There were 396 maternal deaths in 1939 to 450 in 1938, or 54 fewer deaths and 946 fewer births. This gives a maternal mortality rate of 5.0 per 1,000 live births. There were 222 white, 172 negro and 2 Indian puerperal deaths, accounting for a death rate of 4.2 per 1,000 live births for the white and 6.8 for the colored.

TABLE 2.—TOTAL MATERNAL DEATHS AND RATES,
1929-1939

Year	No. of Deaths	Rate
1929 -----	684	8.8
1930 -----	645	8.4
1931 -----	640	8.5
1932 -----	555	7.1
1933 -----	535	7.1
1934 -----	605	7.6
1935 -----	554	7.0
1936 -----	532	7.0
1937 -----	445	5.6
1938 -----	450	5.6
1939 -----	396	5.0

Albuminuria and eclampsia, as in previous years, accounted for more of the puerperal deaths than any other single cause. The second and third greatest offenders were puerperal septicemia and puerperal hemorrhage, respectively. Albuminuria and eclampsia

with other toxemias of pregnancy account for 115 maternal deaths, which is 29 per cent of all maternal deaths.

Infant Mortality: The total number of deaths under one year of age was 4,670 or 791 fewer than occurred in 1938. The rate for 1939 was 59.1 per 1,000 live births and 68.3 in 1938. Of the total deaths 2,722 were white and 1,948 colored. This gave a rate of 51.1 for the white and 76.7 for the colored. The number of deaths of infants under one year of age and the infant mortality rates per 1,000 live births for the past eleven years are shown in Table 3.

TABLE 3.—TOTAL INFANT DEATHS AND RATES,
1929-1939

<i>Year</i>	<i>No. of Deaths</i>	<i>Rate</i>
1929 -----	6,112	79.2
1930 -----	6,021	78.4
1931 -----	5,459	73.0
1932 -----	5,173	66.4
1933 -----	4,974	66.0
1934 -----	6,196	77.9
1935 -----	5,407	67.9
1936 -----	5,221	68.4
1937 -----	5,164	65.1
1938 -----	5,461	68.3
1939 -----	4,670	59.1

Five principal causes of infant mortality accounted for 68 per cent of all infant deaths. These causes with the number of infant deaths charged to each were as follows:

Premature birth -----	1,438
Diarrhea and enteritis -----	541
Pneumonias -----	489
Sudden death (cause not specified) -----	445
Congenital malformations -----	289
Total -----	3,202

Of the 4,670 deaths of infants under one year of age 1,221 or 26 per cent died during the first day of life and 2,037 or 44 per cent within the first week.

REGISTRATION

Every birth and death occurring in North Carolina should be recorded with the Bureau of Vital Statistics. To the individual

the registration of a birth occurring in North Carolina makes it possible always to obtain an official record of the facts surrounding his advent into life. The purposes for which certified copies of birth certificates are requested indicate that their value is becoming more generally realized from year to year. The National Defense Program has greatly increased the demand for birth certificates to prove citizenship. Likewise, the demand for death certificates show that this vital record is essential in upholding the right of citizens in the establishment of necessary facts in the closing event of life.

Vital Statistics are of inestimable value to the public health workers, but without complete registration full reliance cannot be placed on the data. For health organizations accurate certificates are essential if our true problems are to be known, if our programs are to be intelligently planned and we are to ascertain their effectiveness and if errors in our work are to be detected. It is, therefore, important that every effort be made to promote the completeness of our birth and death records.

TABLE 1.—TOTAL BIRTHS AND DEATHS (EXCLUSIVE OF STILLBIRTHS) WITH RATE PER 1,000 POPULATION FOR THE YEARS 1914-1939 INCLUSIVE

YEAR	Births		Deaths
